File Attribution - "MasterMine for GoldMine"

File Type - Windows Installer

Observations-

Dynamic analysis of the MSI file, `MMInstall\_GM\_10\_1.msi`, was conducted by executing it via `msiexec.exe`, which subsequently dropped numerous files consistent with a standard MasterMine installation package as observed in below images.

During analysis of the process tree, `icacis.exe` was observed being leveraged through an MSI custom action chain. This initially drew attention due to the broad *Everyone:(OI)(CI)F* permission grant applied recursively, along with silent prompt suppression via *Echo Y|*, patterns that might overlap with known malicious TTPs and warranted closer examination.

Upon hash verification of *MMconfig.exe* and *MasterMine.exe* against VirusTotal, both were confirmed clean.

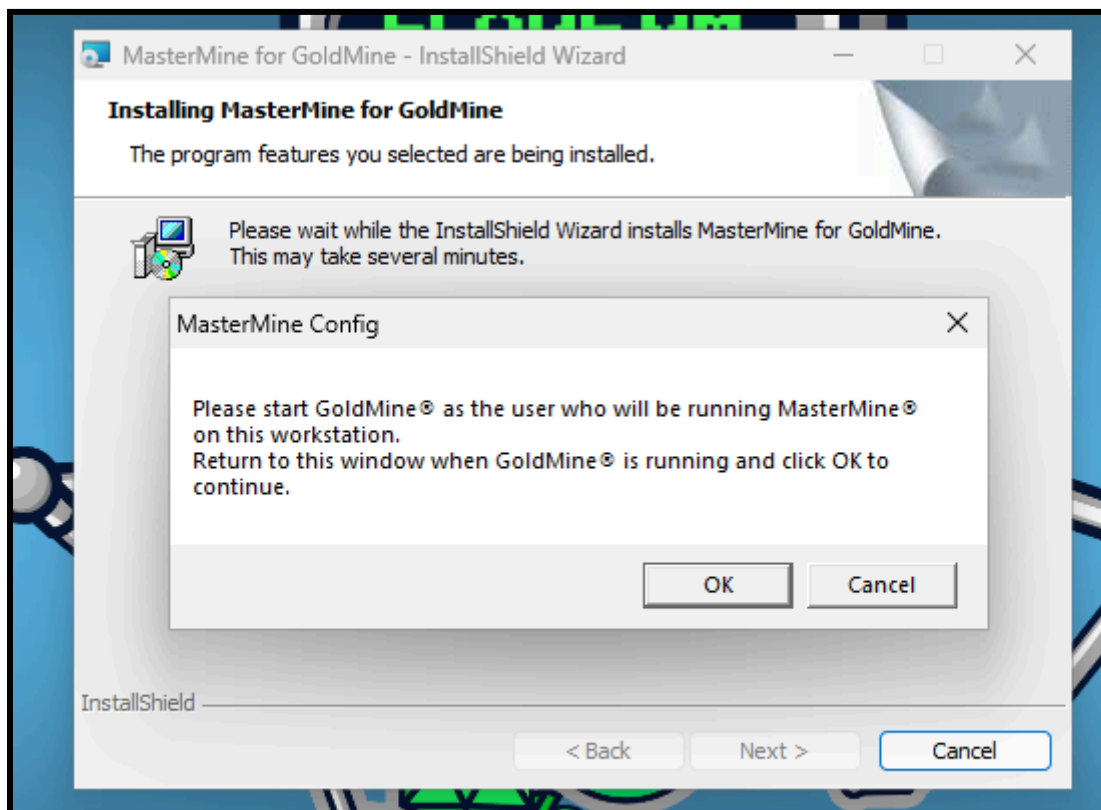

Further, both binaries were found to carry valid digital certificates with valid countersignatures and from a verified publisher, strongly corroborating their authenticity as legitimate vendor-signed executables.

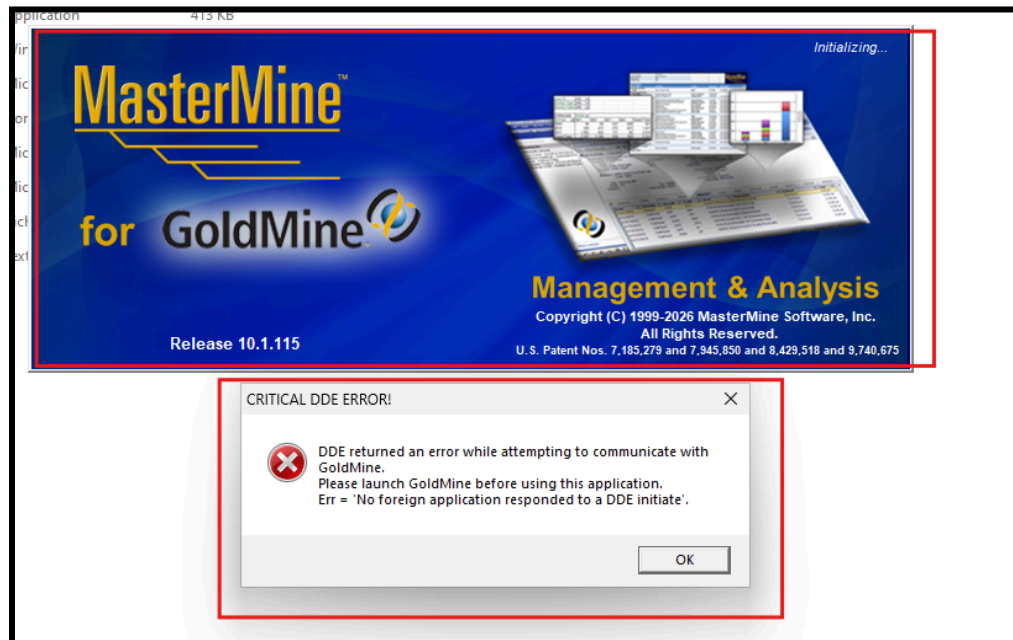

The behavior was therefore assessed to be consistent with standard ISV (Independent Software Vendor) installer practice. MasterMine's shared `.mdb` CRM database files, stored in `ProgramData`, require write access across all user accounts, and the use of `icacls` via a `cmd.exe` custom action is a well-documented workaround for the limitations of the MSI `LockPermissions` table. This was determined to reflect an overly permissive but commonplace installer pattern among business software vendors, and was not assessed to be a concrete indicative of malicious activity.

Attempts were subsequently made to launch `MasterMine.exe`, (SHA256 - c0613832f192f6565425e645019a863e4c9ac0ff53ce845b40f527b9a40d96d0) the primary executable for the MasterMine for GoldMine tool, however, its intended functionality could not be observed as GoldMine, the dependent CRM software, was not available in the analysis environment.

Efforts to procure a trial version of GoldMine for testing purposes were also undertaken, but it was discovered that **no trial version is offered by the vendor**, precluding any further behavioral assessment of the executable.

Consequently, the full functionality of the dropped executable could not be conclusively determined. It is noted, however, that the file hashes of all dropped files were verified against VirusTotal and were returned as clean, consistent with legitimate MasterMine for GoldMine related executables.

2. File Name - "Setup.exe"

File SHA256 -

b7f2245e1851038bf9510a0dd6bfffbc29a0ce55f2b4fa59194452f8a2e7234d

File Attribution - "MasterMine for QuoteWerks"

File Type - Win32 Executable

Observations-

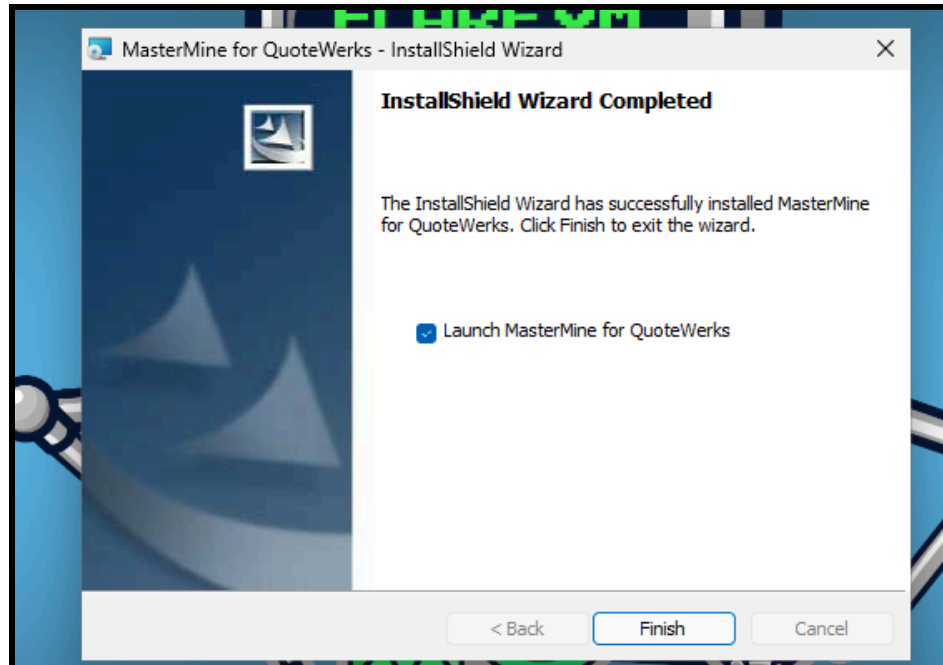

Dynamic analysis of `Setup.exe`, an installer for MasterMine for QuoteWerks, was conducted, during which the executable was observed decompressing and deploying `MasterMine for QuoteWerks.msi` via `msiexec.exe`.

The screenshot displays the Windows Process Tree window, showing a list of processes and their commands. The process tree is expanded to show the execution of Setup.exe (PID 11704) and its interaction with msiexec.exe (PID 11704). The command for msiexec.exe is highlighted in blue, indicating it is the current process being analyzed.

Go To Event Include Process Include Subtree Close

The subsequent installation behavior was found to be consistent with that observed in the previously analyzed MasterMine installer, and all dropped files were verified against VirusTotal and returned as clean. Two files, `MasterMine.exe` and `MasterMine.mdb`, were noted to have no existing samples on VirusTotal, and as such could neither be confirmed as clean nor flagged as malicious through this avenue alone.

`MasterMine.exe`, (SHA256 - 2a4356447e1b6dfa16b738c66f0b227a9a93fb12b287c3b688c5d8d413b32dbf) the primary binary for MasterMine for QuoteWerks, was subsequently launched for behavioral observation. No notable or anomalous activity was captured in Procmon beyond what would be expected of an application attempting to initialize without its dependent software present, as QuoteWerks was not available in the analysis environment.

Attempts were made to procure a trial version of QuoteWerks, however, **only a web-based trial was found to be available**, which would not have been compatible with the locally installed MasterMine for QuoteWerks instance, thereby rendering integration-based testing unfeasible.

Common Note-

Both ``Setup.exe`` and ``MMInstall_GM_10_1.msi`` were additionally executed within a SimSpace test environment provisioned with CrowdStrike endpoint protection. **No detections were raised during either execution**, however, it is noted that the absence of dependent software may have limited the full execution of the applications' intended functionality, and as such this observation is reflective only of the behavior exhibited within the constraints of the test environment.

Conclusion-

In conclusion, due to the absence of the required dependent software and the consequent lack of observable runtime behavior, a fully conclusive determination could not be reached. However, based on the static analysis conducted, the behaviors observed within the available scope, and the absence of any CrowdStrike detections in a controlled environment, nothing examined was found to conclusively suggest malicious intent at this time.
